- Blog integration. - coming soon -
- Social networking websites. - coming soon -
- Multi-language site development: * Live Client site at: www.altiris.com.cn

Web applications of sorts are built to facilitate the completion of one or more varying tasks.

Unlike the traditional approach, curious visitors look forward to be well-served and invariably arrive with specific goals, tasks and/or expectations. TheWebXpert skillfully delivers required web applications to meet specific requirements.

Project planning, feasibility study

TheWebXpert first establishes a high-level view of intended projects before conducting feasibility studies and jointly determining the winning goals.

System analysis, requirements definition

TheWebXpert keeps a strict hand on system analysis. With clarity on the required functions and operations of the intended application, supported with careful analysis of end-user information and needs, TheWebXpert efficiently delivers clients' project scopes.

Systems design

Based on clients' project objectives, TheWebXpert gathers requirements, proposes and implements key deliverables that may include screen layouts, business rules, process diagrams, pseudo codes and other related documentations.

Implementation

At TheWebXpert, we believe our software engineers do not merely own technical skill sets; they help turn dreams into reality.

Integration and testing

The WebExpert groups the usually unattended independent elements, pieces and prepares them for a special test environment, conducting checks on errors, bugs and inter-operability.

Acceptance, installation, deployment

Realising the importance of the final touches that may well deliver the winning element, TheWebXpert pays attention to the final stages of the initial development. Applications are put into production before being run in the actual business.
